

$$T_{01} = \begin{bmatrix} C\alpha & -S\alpha & 0 & 0 \\ S\alpha & C\alpha & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$T_{12} = \begin{bmatrix} C\beta & 0 & -S\beta & L_1 \\ 0 & 1 & 0 & 0 \\ S\beta & 0 & C\beta & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$T_{23} = \begin{bmatrix} C\gamma & 0 & -S\gamma & L_2 \\ 0 & 1 & 0 & 0 \\ S\gamma & 0 & C\gamma & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$T_{3-ee} = \begin{bmatrix} 1 & 0 & 0 & L_3 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$T_{0-ee} = T_{01} T_{12} T_{23} T_{3-ee}$$

This will be of the form $\begin{bmatrix} x \\ y \\ z \end{bmatrix}$

On Multiplying, we get

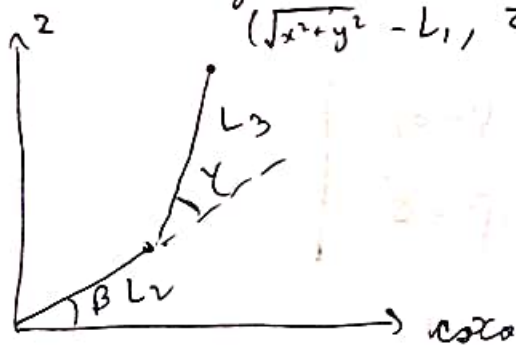

$$x = C\alpha [L_3 \cos(\beta + \gamma) + L_2 C\beta + L_1]$$

$$y = S\alpha [L_3 \cos(\beta + \gamma) + L_2 C\beta + L_1]$$

$$z = L_3 \sin(\beta + \gamma) + L_2 S\beta$$

we get $\alpha = \tan^{-1}\left(\frac{y}{x}\right)$ easily.

Then taking the plane containing z-axis and coxa,

containing z-axis and coxa,

$$\text{Let } r = \sqrt{x^2 + z^2} - L_1$$

Using vector addition,

$$L_2^2 + L_3^2 + 2L_2L_3 \cos \gamma = r^2 + L_1^2$$

$$\therefore \gamma = \cos^{-1}\left(\frac{r^2 + L_1^2 - L_2^2 - L_3^2}{2L_2L_3}\right)$$

Also from the graph,

$$L_2 \cos \beta + L_3 \cos(\beta + \gamma) = r$$

$$L_2 \sin \beta + L_3 \sin(\beta + \gamma) = z$$

On expanding and solving, we get

$$\beta = \sin^{-1} \left(\frac{[(L_2 + L_3 \cos \gamma) \times z] + [L_3^* \sin \gamma \times (\sqrt{x^2 + y^2} - L_1)]}{(L_2 + L_3 \cos \gamma)^2 + (L_3 \sin \gamma)^2} \right)$$

Hence we get all the joint angles.
